

Climate Fiction

by Landu Mfutila Mambamba, 18, Portland

A climate fiction story involves a futurist scenario in which climate change has had a devastating impact on the planet. I'm going to create a small story to illustrate the concept:

In 2050, the Earth was unrecognizable due to unfettered climate change. Coastal cities were under water, and once-fertile areas were arid deserts. Humanity was fighting to survive in the midst of violent storms and lethal heatwaves.

In this grim scenario, a group of scientists discovered an ancient technology capable of reversing the effects of climate change. With determination they embarked upon a dangerous journey to find the components needed to activate this technology and restore environmental balance.

As they confronted challenges and obstacles, the group of scientists was also fighting greedy corporate interests that profit from the destruction of the planet. In the climax of the story they managed to activate the technology and unleash an environmental revolution that changed the course of Earth's history.

This fictitious story provides an example of how climate fiction can address urgent issues involving climate change, and inspire reflection on the importance of protecting the environment. I hope you have enjoyed this narrative!
